## Chapter 1. Introduction

**DBUnit Rules** aims for bringing **DBUnit** closer to your JUnit tests. Here are the main features:

• JUnit rule to integrate with DBUnit via annotations:

```
@Rule
public DBUnitRule dbUnitRule = DBUnitRule.instance(jdbcConnection);①

@Test
@DataSet(value = "datasets/yml/users.yml")
public void shouldSeedDataSet(){
    //database is seed with users.yml dataset
}
```

- 1 The rule depends on a JDBC connection.
- CDI interceptor to seed database without rule instantiation;
- Json, Yaml, xml and flat xml support;
- Cucumber integration;
- JPA integration;
- Multiple database support;
- Date/time support in datasets;

The project is composed by 5 modules:

- Core: Contains the dataset executor and JUnit rule;
- CDI: provides the DBUnit interceptor
- Cucumber: a CDI aware cucumber runner;
- JPA: Comes with a dataset executor based on JPA entity manager
- Examples module.

# Chapter 2. Summary

Scenarios			Steps							Features: 2			
Passed	Failed	Total	Passed	Failed	Skippe d	Pendin g	Undefi ned	Missin g	Total	Durati on	Status		
Seeding database with DBUnit Rules CDI module													
1	0	1	4	0	0	0	0	0	4	969ms	passed		
Seeding database with DBUnit Rules Core module													
1	0	1	1	0	0	0	0	0	1	004ms	passed		
Totals													
2	0	2	5	0	0	0	0	0	5	973ms			

## Chapter 3. Features

### 3.1. Seeding database with DBUnit Rules CDI module

In order to manage database state in CDI based tests As a developer

I want to use DBUnit in a CDI test environment.

DBUnit CDI integration is done through a CDI interceptor.

CDI must be enabled in your test, see the following example:

```
@RunWith(CdiTestRunner.class) ①
public class DBUnitCDITest {
}
```

① CdiTestRunner is provided by Apache Deltaspike but you should be able to use other CDI test runners.

### 3.1.1. Scenario: Seed database using yml dataset

Given

#### DBUnit interceptor is enabled in your test beans.xml: d (558ms)

#### src/test/resources/META-INF/beans.xml

Your test itself must be a CDI bean to be intercepted. if you're using Deltaspike test control just enable the following property in test/resources/META-INF/apache-deltaspike.properties:

deltaspike.testcontrol.use\_test\_class\_as\_cdi\_bean=true

And

#### The following dataset do (000ms)

```
src/test/resources/dataset/yml/users.yml
```

```
user:
  - id: 1
    name: "@realpestano"
  - id: 2
    name: "@dbunit"
tweet:
 - id: abcdef12345
    content: "dbunit rules!"
    user_id: 1
  - id: abcdef12233
    content: "dbunit rules!"
    user id: 2
  - id: abcdef1343
    content: "CDI for the win!"
    user_id: 2
follower:
  - id: 1
    user_id: 1
    follower_id: 2
```

#### When

```
@Test
  @UsingDataSet("yml/users.yml")
public void shouldSeedUserDataSetUsingCdiInterceptor() {
    List<User> users = em.createQuery("select u from User u order
by u.id asc").getResultList();
    User user1 = new User(1);
    User user2 = new User(2);
    Tweet tweetUser1 = new Tweet();
    tweetUser1.setId("abcdef12345");
    assertThat(users).isNotNull().hasSize(2).contains(user1,
user2);
    List<Tweet> tweetsUser1 = users.get(0).getTweets();

assertThat(tweetsUser1).isNotNull().hasSize(1).contains(tweetUser1);
}
```

The database should be seeded with the dataset content before test execution database (411ms)

### 3.2. Seeding database with DBUnit Rules Core module

In order to manage database state in JUnit tests As a developer I want to use DBUnit in my tests.

DBUnit Rules Core module brings DBunit to your unit tests via JUnit rules.

### 3.2.1. Scenario: Seed database using yml dataset
